Mucleotide sequence of bovine interleukin-6 cDNA.";

NA Seq. 2:411-413(1992).

-I- FUNCTION: IL-6 is a cytokine with a wide variety of biological functions: it plays an essential role in the final differentiation of B-cells into Ig-secreting cells, it induces myeloma and plasmacytoma growth, it induces nerve cells differentiation, in hepatocytes it induces acute phase reactants.

-I- SUBCELLULAR LOCATION: Secreted.
-I- SIMILARITY: Belongs to the IL-6 superfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DISULFID

                                                                                                                                                                 FUNCTION: II-6 is a cytokine with a wide variety of biological functions: it plays an essential role in the final differentiation of B-cells into Ig-secreting cells, it induces myeloma and plasmacytoma growth, it induces nerve cells differentiation, in hepatocytes it induces acute phase reactants (By similarity). SUBCELLULAR LOCATION: Secreted.

SIMILARITY: Belongs to the II-6 superfamily.

                                                                                                                              A;Description: transfers one electron from pyruvate to flavodoxin
A;Pathway: nitrogen fixation
C;Superfamily: pyruvate (flavodoxin) dehydrogenase; ferredoxin 2[4Fe-4S] homology
C;Superfamily: pyruvate (flavodoxin) dehydrogenase; protein; metalloprotein; oxidoreducta
C;Keywords: 4Fe-4S; electron transfer; iron-sulfur protein; metalloprotein; oxidoreducta
C;Keywords: 4Fe-4S; electron transfer; iron-sulfur protein; metalloprotein; oxidoreducta
F;684-763)Domain: ferredoxin 2[4Fe-4S] homology <FER>
F;691,694,697,755/Binding site: 4Fe-4S cluster (Cys) (covalent) #status predicted
F;701,745,748,751/Binding site: 4Fe-4S cluster (Cys) (covalent)
                                                                                                                                                                                                                                                                                                                                                                                                                         A; Gene: nifJ
